What is a Projectile and Projectile Motion? When gravity force is acting on an object is called projectile. Other forces are also acting upon it but those all are minimal effect on a projectile object. The motion created by the projectile to coming back to the surface is called projectile motion. This motion is angular and has two dimensions.

Projectile motion refers to the motion of an object projected into the air at an angle, water fountains are an example. They move along a curved path (or trajectory) under the action of gravity. Projectile motion only occurs when there is a force applied at the beginning of the trajectory, after which there is no other force apart from gravity.

In our example, the baseball is a projectile. A projectile is a moving object that is solely under the influence of gravity. Things like cannonballs, bullets, baseballs, and trebuchets are all subject to projectile motion. TL;DR: Too Long, Didn't Read. The main equations of motion for a projectile with respect to time t are:
