An introduction to NURBS - formpig

Non-uniform rational basis spline (NURBS) is a mathematical model commonly used in computer graphics for generating and representing curves and surfaces. It offers great flexibility and precision for handling both analytic (surfaces defined by common mathematical formulae) and modeled shapes. NURBS are commonly used in computer-aided design (CAD), manufacturing (CAM), and engineering (CAE) and are part of numerous industry wide standards, such as IGES, STEP, ACIS, and PHIGS. NURBS tools are also

So far, all has been theoretical, the best way to learn of course is to start creating forms directly into any NURBS modeling software. This was merely a brief introduction for modelers out there who still haven't incorporated NURBS modeling into their workflow, and to give a general idea on the whole process.

NURBS Introduction

NURBS++ generates two types of standard curves automatically: a circle or a line. You can create a circle centered at (0;0;0) of radius 1 and having a starting and ending angle of 0 and 2π respectively. Since a NURBS curve is rational, it can represent exactly a circle. Something that a B-Spline can't do. NurbsCurvef curve ;

Gathered here are a number of useful algorithms. The algorithms are implementations of the pseudocode in Appendix C of An Introduction to NURBS. Here the algorithms have been loosely translated into a 'real' programming language, i.e., C. Hopefully, the availability of the algorithms in C will increase your understanding of the algorithms and hence of the underlying mathematics.

NURBS: An Introduction

An introduction to NURBS Philippe Lavoie January 20, 1999 A three dimensional (3D) object is composed of curves and surfaces. One must find a way to represent these to be able to model accurately an object. The two most common methods to represent a curve or a surface are the implicit and the parametric method.
