Special cameras collect remotely sensed images, which help researchers "sense" things about the Earth. Some examples are:

Applications of remote sensing techniques to geology

Remote sensing in geology is remote sensing used in the geological sciences as a data acquisition method complementary to field observation, because it allows mapping of geological characteristics of regions without physical contact with the areas being explored. About one-fourth of the Earth's total surface area is exposed land where information is ready to be extracted from detailed earth ...

Remote sensing (geology) - Wikipedia

Geology: Remote sensing can help map large, remote areas. This makes it possible for geologists to classify an area's rock types, study its geomorphology, and track changes caused by natural events such as floods and landslides.; Agriculture: Remote sensing is also helpful when studying vegetation. Photographs taken remotely allow biogeographers, ecologists, agriculturalists, and foresters to ...
