Behavior-Based Robotics | The MIT Press

Behavior-based robotics The quest to generate intelligent machines has now (2007) been underway for about a half century. While much progress has been made during this period of time, the intelligence of most autonomous robots in use today reaches, at best, the level of insects, rather than the level of humans. Indeed, during the

Behavior-based robotics, and Evolutionary robotics

Behavior Behavior is what an external observer sees a robot doing. Robots are programmed to display desired behavior. Behavior is a result of a sequence of robot actions. Observing behavior may not tell us much about the internal control of a robot. Control can be a black box. Actuators and DOF Mobile robots move around using wheels, tracks, or ...

CS 378: Autonomous Intelligent Robotics

Behavior-based robotics is a style of robotics in which robots are programmed with many independent behaviors that are coupled together to produce coordinated action. The field developed in response to the shortcomings of traditional artificial intelligence (AI): robots were slow and had trouble operating in complex environments because robots ...
