Emergency bleeding control - Wikipedia

Bleeding control and shock management should NOT be the random basic skill. Presently, there is no universally accepted method of applying a tourniquet. Also, there is no way to test this skill on a human subject (like we do for spinal immobilization seated/supine) because you would be applying and removing tourniquets so many times, it would not be

a fun experience for the guy playing patient.

DEPARTMENT OF THE NAVY

Shock caused by bleeding is cured by stopping the bleeding. The body will try to do this on its own, but definitively, in significant trauma, this is almost always accomplished through surgery. Trauma is a surgical disease; its medicine is an operating room, sutures, and cautery.

Understanding Shock IV: Bleeding Control - EMS Basics

Emergency bleeding control describes actions that control bleeding from a patient who has suffered a traumatic injury or who has a medical condition that has caused bleeding. Many bleeding control techniques are taught as part of first aid throughout the world, though some more advanced techniques such as tourniquets, are often taught as being reserved for use by health professionals, or as an absolute last resort, to mitigate associated risks, such as potential loss of limbs. To manage bleeding

Instructions to the Candidate: Bleeding Control/Shock ...

Elevation of the bleeding extremity should be done secondary to and in conjunction with applying direct pressure. Elevate the limb above the level of the heart. Consider laying the patient down to help facilitate elevation of the extremity and to prepare for the shock position.
