Carbon meta-nanotubes : synthesis, properties, and ...

Meta-Nanotubes are a new generation of carbon nanotubes (CNTs) which result from the chemical transformation of regular CNTs and their subsequent combination with foreign materials (atoms, molecules, chemical groups, nanocrystals) by various ways such as functionalisation, doping, filling, and substitution. These new nanomaterials exhibit enhanced or new properties, such as reactivity ...

When Sumio Iijima discovered carbon nanotubes in 1991, they were just thin and long cylinders of carbon and it was unknown at the time what the implications of this discovery would be. The physical properties of carbon nanotubes, including their size, shape and ability to be manipulated, yet stay strong, have made them a unique find amongst other macromolecules.

Abstract. Carbon nanotubes (CNT s) are remarkable objects that once looked set to revolutionize the technological landscape in the near future.Since the 1990s and for twenty years thereafter, it was repeatedly claimed that tomorrow's society would be shaped by nanotube applications, just as silicon-based technologies dominate society today.

B. Introducing meta-nanotubes One motivation for developing meta-nanotubes is to find alternative ways for overcoming some of the recur-rent drawbacks of pristine nanotubes, e.g., the impossi-bility of obtaining a single batch of SWNTs having the same electronic behavior. Another example of motiva-tion is providing nanotubes with properties ...
