The Carnot engine is free from friction and heat losses. Sadi Carnot showed that a heat engine operating in an ideal reversible cycle between two heat reservoirs at different temperatures would be the most efficient.

A refrigerator operating on the reversed Carnot cycle has ...

Carnot's Heat Engine. According to the second law of thermodynamics, no heat engine can have 100% efficiency; Carnot's heat engine is an idealized heat engine that has maximum possible efficiency according to the second law.

Example of Rankine Cycle – Problem with Solution

Overview The Carnot Cycle is an entirely theoretical thermodynamic cycle utilising reversible processes. The thermal efficiency of the cycle (and in general of any reversible cycle) represents the maximum possible efficiency (this statement is also known as Carnot's theorem - for a more detailed discussion see also Second Law of Thermodynamics).
