Psychology 240: Statistics 1 Lectures: Chapter 6

Any physical theory is a kind of guesswork. There are good guesses and there are bad guesses. The theory of probability is a system for making better guesses. The language of probability allows us to speak quantitatively about some situation which may be highly variable, but which does have some consistent average behavior.

Chapter 6 Probability Models of Derived Random Variables

Answer: $p(x = 130) = 0$, just as it is for any value of x in the interval $120 < x < 140$. The probability density function $f(x)$ does not provide probabilities but only the height of the curve above the horizontal axis at a particular value of x . In this case, the height (but not the probability) is $1/20$.
