The actual pressure at sea level varies with atmospheric conditions, so it is customary to define standard atmospheric pressure as  $1 \text{ atm} = 1.013 \times 10^5 \text{ pa}$  or  $101 \text{ kpa}$ . Although the standard atmosphere is not an SI unit, it is still widely employed. In meteorology, the bar, exactly  $1.000 \times 10^5 = 0.967 \text{ atm}$ , is often used.

Calculating the concentration of a chemical solution is a basic skill all students of chemistry must develop early in their studies. What is concentration? Concentration refers to the amount of solute that is dissolved in a solvent. We normally think of a solute as a solid that is added to a solvent (e.g., adding table salt to water), but the solute could easily exist in another phase.

$N = N_0 e^{-kt}$ , where  $N$  is the amount of substance,  $N_0$  is the amount of substance at time zero,  $k$  is the rate constant for the decay, and  $t$  is time. If we didn't know the units for the rate constant, we could use the fact that the product  $kt$  must be dimensionless to work them out.
