Novel computational and analytical methods for quantum dynamics are an equally important part of our work, complementing and often driving the experimental programme. Our long term research goals are to apply this knowledge to the study of much more complicated reactions and processes, building links with biology and quantum physics, as well as atmospheric and astrophysical chemistry.

Density-functional theory (DFT) is a computational quantum mechanical modelling method used in physics, chemistry and materials science to investigate the electronic structure (or nuclear structure) (principally the ground state) of many-body systems, in particular atoms, molecules, and the condensed phases. Using this theory, the properties of a many-electron system can be determined by using ...
