Hello friends, in this blog article, we will learn Block diagram algebra in the control system. It will include block diagram reduction rules, some block diagram reduction examples and solutions. We know that the input-output behavior of a linear system is given by its transfer function:  $G(s)=C(s)/R(s)$  where  $R(s)$  = Laplace transform of the input variable ...

Let us discuss these rules, one by one for reduction of control system block diagram. If you're looking to do some control systems study, check out our control systems MCQs. If the transfer function of input of control system is  $R(s)$  and the corresponding output is  $C(s)$ , and the overall transfer function of the control system is  $G(s)$ , then the control system can be represented as:

Basic Elements of Block Diagram. The basic elements of a block diagram are a block, the summing point and the take-off point. Let us consider the block diagram of a closed loop control system as shown in the following figure to identify these elements. The above block diagram consists of two blocks having transfer functions  $G(s)$  and  $H(s)$ .

Block Diagram in control systems. Any system can be described by a set of differential equations, or it can be represented by the schematic diagram that contains all the components and their connections. However, these methods do not work for complicated systems. The Block diagram representation is a combination of these two methods.

Shifting Take-off Point After the Block. When you shift the take-off point after the block, the output will be same. But, there is difference in value. So, in order to get the same value, we require one more block. It is having the input and the output is. This block diagram is shown in the following figure.

E-mail: [cmei@umich.edu](mailto:cmei@umich.edu). Due to their simplicity and versatility, block diagrams are widely used by control engineers to model all types of dynamic systems. The complexity of a block diagram is in general caused by the existence of summing/pickoff points within a loop.

Note – Follow these steps in order to calculate the transfer function of the block diagram having multiple inputs. Step 1 – Find the transfer function of block diagram by considering one input at a time and make the remaining inputs as zero. Step 2 – Repeat step 1 for remaining inputs. Step 3 – Get the overall transfer function by adding all those transfer functions. The block diagram reduction process takes more time for complicated systems.

- The output is the algebraic sum of the inputs.
- Any number of inputs may enter a summing point.
- Some books put a cross in the circle.

4. Introduction • In order to have the same signal or variable be an input to more than one block or summing point, a takeoff point is used.
