Cryptography Using Chebyshev Polynomials

Thank you definitely much for downloading cryptography using chebyshev polynomials. Maybe you have knowledge that, people have look numerous time for their favorite books subsequent to this cryptography using chebyshev polynomials, but end occurring in harmful downloads.

Rather than enjoying a fine ebook subsequently a mug of coffee in the afternoon, then again they juggled later some harmful virus inside their computer. cryptography using chebyshev polynomials is within reach in our digital library an online

permission to it is set as public correspondingly you can download it instantly. Our digital library saves in fused countries, allowing you to acquire the most less latency period to download any of our books once this one. Merely said, the cryptography using chebyshev polynomials is universally compatible taking into consideration any devices to read.

Now that you have a bunch of ebooks waiting to be read, you'll want to build your own ebook library in the cloud. Or if you're ready to purchase a dedicated ebook reader, check out our comparison of Nook versus Kindle before you decide.

Chebyshev polynomials - Wikipedia

A newly proposed public key crypto method based on Chebyshev polynomials [16] recommend a new approach to data encryption. This paper provides an overview of three major types of public key cryptosystems mainly Diffie-Hellman Key Exchange Algorithm, the RSA Cryptosystem, the ElGamal Encryption Method and their implementation using Chebyshev Polynomials.

We consider replacing the monomial x^n with the Chebyshev polynomial $T_n(x)$ in the Diffie-Hellman and RSA cryptography algorithms. We show that we can generalize the binary powering algorithm to compute Chebyshev polynomials, and that the inverse problem of computing the degree n , the discrete log problem for $T_n(x) \bmod p$, is as difficult as that for $x^n \bmod p$.

The Chebyshev polynomials are two sequences of polynomials, denoted $T_n(x)$ and $U_n(x)$. They are defined as follows. By the double angle formula, $\cos(2\theta) = 2\cos^2(\theta) - 1$ is a polynomial in $\cos(\theta)$, so define $T_2(x) = 2x^2 - 1$. The other $T_n(x)$ are defined similarly, using $\cos(n\theta) = T_n(\cos(\theta))$. Similarly, define the other sequence by $\sin(n\theta) = U_{n-1}(\cos(\theta)) \sin(\theta)$, where we have used de ...
