Conservation laws must be fulfilled for mass, momentum, angular momentum, etc. during a deformation. These laws are described first in detail. Then, the Cauchy stress tensor is defined and further, based on it, various stress tensors are derived from the Cauchy stress tensor. Introducing the stress tensor, the equilibrium equations of force and moment are formulated from the conservation laws.

Deformation Stress And Conservation Laws
Deformation, Stress, and Conservation Laws In this chapter, we will develop a mathematical description of deformation. Our focus is on relating deformation to quantities that can be measured in the field, such as the change in distance between twopoints, the change in orientation of a line, or the change in volume of a borehole strain sensor.

Deformation (mechanics) - Wikipedia

From the above investigation, the Virial stress is the reasonable stress definition in MD simulations. However, using the Virial stress, the current deformation scheme for the bulk case cannot guarantee energy conservation during the deformation. The calculated internal energy change is less than the external work.

INTRODUCTION TO FINITE STRAIN THEORY FOR CONTINUUM ELASTO ...

The continuity equation reflects the fact that the molecule is always somewhere—the integral of its probability distribution is always equal to 1—and that it moves by a continuous motion (no teleporting). Quantum mechanics. Quantum mechanics is another domain where there is a continuity equation related to conservation of probability. The ...

1.3 Stresses, Pressure, Velocity, and the Basic Laws. Stresses. The concept of a force should be readily apparent. In fluid mechanics, a force per unit area, called a stress, is usually found to be a more convenient and versatile quantity than the force itself. Further, when considering a specific surface, there are two types of stresses that are particularly important.

Continuum Mechanics - Home Page

Deformation in continuum mechanics is the transformation of a body from a reference configuration to a current configuration. A configuration is a set containing the positions of all particles of the body. A deformation may be caused by external loads, body forces (such as gravity or electromagnetic forces), or changes in temperature, moisture content, or chemical reactions, etc.
