## PRACTICAL DESIGN OF WATER DISTRIBUTION SYSTEMS

The water from the desired depth of the river or reservoir can be collected by opening the desired port. In case of emergency and temporary works, movable intakes can be used. In this type of intake pumping plant is installed in a carriage or trolley and the suction pipe having strainer pipe at the end is lowered in the water.

Introduction to Pipe Design using Hazen-Williams Friction Losses This calculation is valid for water flowing at typical temperatures found in municipal water supply systems (40 to 75 o F; 4 to 25 o C). Our calculation is based on the steady state incompressible energy equation utilizing Hazen-Williams friction losses as well as minor losses.

1-Pipe Systems A 1-pipe water distribution system is a system that has a one main pipe looping around the building and then returning.

1-Pipe System Uses Since 1-pipe systems are typically only used for heating, the supply and return are shown connecting to a boiler instead of a chiller. This pipe is both the supply and return main.
