USP37 (ubiquitin specific peptidase 37) is a 979 amino acid protein that contains three UIM (ubiquitin-interacting motif) repeats and belongs to the peptidase C19

Online Library Usp37

family. Expressed in prostate and brain tissue, USP37 functions to catalyze the conversion of a ubiquitin C-terminal thioester to a free ubiquitin and a thiol.

USP37 | definition of USP37 by Medical dictionary

USP37 (Ubiquitin Specific Peptidase 37) is a Protein Coding gene. Among its related pathways are Deubiquitination and

Online Library Usp37

Metabolism of proteins. Gene Ontology (GO) annotations related to this gene include protein kinase binding and thiol-dependent ubiquitin-specific protease activity. An important paralog of this gene is USP29.
