Part 1 For the beams shown, assume that $EI = 150,000 \text{ kN-m}$, $P = 100 \text{ kN}$, and $w = 65 \text{ kN/m}$. Use discontinuity functions to determine (a) the reactions at B, C, and D. (b) the beam deflection at A. Assume $LAB = 2.75 \text{ m}$, $LBC = LCD = 7.00 \text{ m}$. ?? LBC LCD Sum the forces in the y direction to find an expression that includes the reaction forces B_y , C_y , and D, acting on the beam.

The moment distribution method is a structural analysis method for statically indeterminate beams and frames developed by Hardy Cross. It was published in 1930 in an ASCE journal. The method only accounts for flexural effects and ignores axial and shear effects. From the 1930s until computers began to be widely used in the design and analysis of structures, the moment distribution method was ...
