Baird University of Massachusetts Lowell PROBLEM: The two-dimensional region, $0 \leq x \leq a$, $0 \leq y \leq b$, is bounded by conducting surfaces at $x = 0$, $x = a$, and $y = b$ held at zero potential, as indicated in the sketch. At large z the potential is determined by some configuration of charges and/or conductors at fixed potentials.

2.1.3 The Electric Field the total force on Q is evidently E is called the Electric Field of the source charges. Physically, $E(r)$ is the force per unit charge that would be exerted on a test charge, if you were to place one at P . Notice that it is a function of position (r), because the separation vectors r depend on the location of the field point P .
