The problem is that the circuits fitted during older days were not designed to power different types of electronic equipment or lighting of this era. There may be obvious signs of strains with more extension cords and single outlet paving the way to sprout power strips or lurking not seen at the back of ceilings, walls and cover plates.

A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power. $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$. Total power in a parallel circuit is the sum of the power consumed on the individual branches.

Solution : The conditions of the problem suggest that diode D1 is forward biased and diode D2 is reverse biased. We can, therefore, consider the branch containing diode D2 as open as shown in Fig. 4 (ii). Further, diode D1 can be replaced by its simplified equivalent circuit. Q5. Find the voltage V A in the circuit

Sheet (2) Magnetic circuits Solution

Electrical-engineering and electronic-engineering students have frequently to resolve and simplify quite complex circuits in order to understand them or to obtain numerical results and a sound knowledge of basic circuit theory is therefore essential. The author is very much in favour of tutorials and the solving of problems as a method of ...

Circuit Breaker Keeps Tripping; If your circuit breaker keeps on tripping, chances are they have detected some issues in the current circuit. That is where they get the name 'circuit breakers' because they break up circuits when they sense that there is something wrong with the flow of current. Solution

Solution: Let the terminal a-b be open circuited. This leads to $I_1 = 0$ and the depending voltage sources $2I_1$ is also zero. Also, $I_2 = 0$. Obviously $V_{o.c}$ (i.e., the open circuit voltage across a-b) is zero. Next, a dc voltage supply v_{dc} be applied across a-b such that the input current be I_1 at terminal a.
