The SP383 EFI incorporates a port-style injection system, with the injectors plumbed in a carburetor-style intake manifold and the throttle body mounted in the conventional position of the carburetor, which allows for a traditional air cleaner and a classic appearance.

EFI, or any fuel injection system, utilizes a special high-pressure fuel deliver nozzle to inject an ultra-fine mist of fuel into the engine. An electronic control unit uses sensors around the engine to deliver the precise amount of fuel the engine needs, improving response, efficiency and starting.

The bottom line is that trying to run EFI on a marine engine is not something you can do as an afterthought. You need to intimately know the system you are using, its capabilities and limitations, install it correctly and have it tuned with someone with experience specific to marine applications.

Typically EFI equipped engines produce around 5% to 10% more power than a carbureted version of the same engine. Enhanced Reliability. Engines equipped with EFI systems are inherently more reliable than carbureted engines. This follows from the ability of the EFI control systems to maintain optimum air/fuel ratios during all phases of flight.

Throttle Body style EFI systems feature fuel rails and injectors mounted directly to a throttle body. This design delivers the fuel into the air flow stream in the plenum similar to a carburetor. It's the most universal type of Electronic Fuel Injection system, but it's not ideal for high performance engines.

Electronic Fuel Injection Systems - Walbro

Because mechanical injection systems have limited adjustments to develop the optimal amount of fuel into an engine that needs to operate under a variety of different conditions (such as when starting, the engine's speed and load, atmospheric and engine temperatures, altitude, ignition timing, etc.) electronic fuel injection (EFI) systems were developed that relied on numerous sensors and controls.
