Example Ansys And 3d Element

Example: ANSYS and 3D element (solid45) In this example, we revisit problem #3 of homework 5a. This problem will now be solved using a 8-node 3D element (solid45) rather than the beam (beam3) element. Input commands for this problem are show below. Students are encouraged to consult the ANSYS online help on solid45

second order solid elements. Reduced integration first order solid elements in ABAQUS and ANSYS suffered from hourglassing when a mesh was coarse. If there was only one layer of elements, the reported first mode of the beam examples from ABAQUS and ANSYS was excessively smaller than the converged solutions due to hourglassing.

Also, as mentioned above, for 3D models, the mesh must be tetrahedral. For a full listing of these restrictions, refer to the ANSYS Mechanical User's Guide. A search on 'nonlinear adaptive' will take you to the right location in the Help. Nonlinear Adaptive Regions can be scoped to 3D solid and 2D bodies, or to elements via a Named Selection.

This I really like. I notice that quite a lot of people using FEA even don't know you have to use RBE3 elements to do this kind of interpolation. I learned the hard way, having made the mistake of not interpolating where 3D elements were joined to 2D elements quite often, luckily without the results beinf too far off.
