inductor, the size of the minor B-H loop is proportional to the total current ripple, Fig. 9. Small ripple implies small core loss, as well as small proximity loss. An air gap is employed, and the maximum flux density is limited by saturation. Flyback transformer

Filter Inductor Design

A demonstration of filter inductor design for boost converters, design of the coupled inductor for a two-output forward converter, and the design of flyback transformer in continuous conduction mode. The filter inductor in the converter circuit is operated in a small B-H loop region as compared to the wide region for the conventional transformer.

(A transformer or inductor, is only polarized with ac, while a choke or fly-back transformer has both dc and ac current components). If we assume that the core size, primary turns, and frequency are predefined, the vertical scale B (flux density, Tesla) is proportional to the applied voltage (V in) (you may prefer to think of it in terms of volt seconds).

Why Have an Air Gap? | Power Electronics

The principle behind Flyback converters is based on the storage of energy in the inductor during the charging, or the "on period," ton, and the discharge of the energy to the load during the "off period," toff. There are four basic types that are the most common, energy storage, inductor type converter circuits. 1. Step down, or buck converter. 2.
