Flow in Open Channels by K. Subramanya - Goodreads  
If the flow properties, say the depth of flow, in an open channel remain constant along the length of the channel, the flow is said to be uniform. As a corollary of this, a flow in which the flow properties vary along the channel is termed as non-uniform flow or varied flow.

Manning Formula for Determining Open Channel Flows  
Open-channel flow, a branch of hydraulics and fluid mechanics, is a type of liquid flow within a conduit with a free surface, known as a channel. The other type of flow within a conduit is pipe flow. These two types of flow are similar in many ways but differ in one important respect: the free surface. Open-channel flow has a free surface, whereas pipe flow does not.

Normal depth is the depth of uniform flow in a prismatic open channel. Since the flow is uniform, the depth and discharge are related through Manning's equation with  $S_f = S_o$ . 3.15 Given Q, n, A(y), Rh(y) and  $S_o$ : solve for y n Waves (Small Disturbances) in a Moving Stream y c V Wave (disturbance) can move upstream if  $3.16$  Froude Number

2.2 Open Channel Flow in Meandering Bends. To study flow characteristics in a meandering alluvial channel, a basic understanding of a meandering channel is necessary. This section reports the background of meandering channel geometry, flow patterns in bends, erosion patterns, and channel stability.

Open Channel Flow  
The Manning formula is an empirical formula estimating the average velocity of a liquid flowing in a conduit that does not completely enclose the liquid, i.e., open channel flow. However, this equation is also used for calculation of flow variables in case of flow in partially full conduits, as they also possess a free surface like that of open channel flow.

3.2 Topic 8: Open Channel Flow  
The Manning formula can be used to calculate the flow of water in open non-full channels and pipes without the need for a flume, weir, or other structure. While not as accurate as flows calculated with those structures, the Manning formula is accurate enough for some applications.

Open Channel Flow Example  
In a uniform channel with steady flow, it is equal to the slope of the total head line (ft./ft.).  $S_o =$  Slope of the flow line of a conduit (bed slope). With a steady uniform flow, the water surface, the total head line, and the flow line are all parallel and  $80 = B1$  (ft./ft.).
