A positive charge moving in the same direction as the electric field direction loses potential energy since the potential of the electric field diminishes in this direction.

Electromagnetism | Physics For Idiots

The electric potential of a point is the amount of work that has to be done, per unit charge, to move a point charge from a place of zero potential to that point. This is the electric potential energy of the point divided by the charge at that point - or electric potential energy per unit charge. The difference in electric potential between two

Magnetism Cheat Sheet Magnets exists always in dipoles North Pole (represented by N) and South Pole (represented by S). If you break the rock into pieces you get small magnets and each magnet also has two poles N and S. Same poles of the magnet like in the electricity repel each other and opposite poles attract each other.
