A fracture is the separation of an object or material into two or more pieces under the action of stress. The fracture of a solid usually occurs due to the development of certain displacement discontinuity surfaces within the solid. If a displacement develops perpendicular to the surface of displacement,...

more). The fracture is usully characterized by a flat fracture surface (cleavage) with little or no shear lips and at average stress levels below those of general yielding. Brittle fractures are not so common as fatigue, yielding, or buckling failures, but when they do occur they may be more costly in terms of human life and/or property damage.
