Gas turbine combustors have seen considerable design changes. The original diffusion type combustors were changed to wet combustors by adding water or steam in the combustion zone to restrict the amounts of NO x produced. Most new turbines have progressed to DLE NO x combustors from the wet diffusion type, which were injected by steam in the primary zone of the combustor.

Gas Turbine Engineering Handbook - 4th Edition

S.C. Bhatia, in Advanced Renewable Energy Systems, 2014. Gas turbine efficiency. Turbine efficiency is the ratio of actual work output of the turbine to the net input energy supplied in the form of fuel. For stand-alone gas turbines, without any heat recovery system the efficiency will be as low as 35 to 40 per cent. This is attributed to the blade efficiency of the rotor, leakage through ...
