Genetic Engineering

Genetic engineering, also called genetic modification or genetic manipulation, is the direct manipulation of an organism's genes using biotechnology. It is a set of technologies used to change the genetic makeup of cells, including the transfer of genes within and across species boundaries to produce improved or novel organisms. New

Greater yields can be produced. Genetic engineering can also change the traits of plants or animals so that they produce greater yields per plant. More fruits can be produced per tree, which creates a greater food supply and more profits for a farmer.

Genetic engineering | definition of genetic engineering by ...
Genetic engineering is any process by which genetic material (the building blocks of heredity) is changed in such a way as to make possible the production of new substances or new functions. As an example, biologists have now learned how to transplant the gene that produces light in a firefly into tobacco plants.

Genetic Engineering | Talking Glossary of Genetic Terms | NHGRI

Genetic Engineering. Genetic engineering is the manipulation of genetic material by either molecular biological techniques or by selective breeding. While selective breeding has been practiced for thousands of years (domestication of the dog; farming corn; brewer's yeast) the manipulation of genetic material in vitro was developed in the 1970s.

What is genetic engineering? | Facts | yourgenome.org

Genetic engineering is the process of using recombinant DNA (rDNA) technology to alter the genetic makeup of an organism. Traditionally, humans have manipulated genomes indirectly by controlling breeding and selecting offspring with desired traits. Genetic engineering involves the direct manipulation of one or more genes.
