2.2 Molecular-level answers to questions left behind by classical genetics. Research in molecular biology and genetics has yielded answers to the basic questions left unanswered by classical genetics about the make-up of genes, the mechanism of gene replication, what genes do, and the way that gene differences bring about phenotypic differences.

In molecular biology and genetics, transformation is the genetic alteration of a cell resulting from the direct uptake and incorporation of exogenous genetic material from its surroundings through the cell membrane(s). For transformation to take place, the recipient bacterium must be in a state of competence, which might occur in nature as a time-limited response to environmental conditions ...
