The genodermatoses are a large group of inherited disorders with skin manifestations. Many of these disorders are rare. However, the recognition of their skin findings is important not only for the initiation of appropriate therapy but also for the detection of other associated abnormalities, including malignancy, in these frequently multisystem disorders [1-3].

Genodermatoses: A Clinical Guide to Genetic Skin Disorders

Genodermatoses are an inherited disorder, present with multisystem involvement. Help us to identify regular mutations and appalling skin diseases with recessive inheritance. Genetic heterogeneity is very common, and molecular diagnosis requires a broad effort. Recurrent mutations in unrelated families were seen in families with xeroderma, Griscelli.
