*It is the main tool in the differential geometric treatment of curves because it is far easier and more natural to describe local properties (e.g. curvature, torsion) in terms of a local reference system than using a global one such as Euclidean coordinates.*

*A key element of this paper is the distinction between local and global properties of curves. Roughly speaking, local properties refer to small parts of the curve, and global properties refer to the curve as a whole. Examples of local properties include regularity, curvature, and torsion, all of which can be defined at an individual point.*

*Fundamental objects as curvature, torsion and Frenet equations are introduced. We end the analysis of local properties of curves by stating and proving the local canonical form for curves in space. We finally study some global properties of plane curves, in particular the winding number and the rotation index.*

### *Treger : Local properties of families of plane curves*

*The theory of curves and surfaces was established long ago. Yet applying the general theory to individual objects is not easy. For instance, integrating the curvature over a curve or constructing a curve with assigned curvature can be very difficult even in the simplest cases. This is because it is not possible in general to solve differential equations explicitly.*

Handout 2: Global properties of plane curves. Definitions. A plane curve  $\alpha: [a,b] \rightarrow \mathbb{R}^2$  is closed if  $\alpha(a) = \alpha(b)$ . It is immersed if  $\alpha'(t) \neq 0$  for any  $t \in [a,b]$ . Let  $p \in \mathbb{R}^2$  be a point not on the curve  $\alpha$ . The winding number  $w_\alpha(p)$  of an oriented closed curve  $\alpha$  around  $p$  is total number of (signed) turns made by  $\alpha$  around the point  $p$ .*

ClosedCurvesandSpaceCurves (Com S 477/577 Notes) Yan-BinJia Oct10,2019 So far we have discussed only 'local' properties of (plane) curves. These properties depend only on the behavior of a curve near a given point, and not on the 'global' shape of the curve. Now let us look at some global results about curves.*
