bed profile, but it also mainly results in the change in bed porosity defined as a fraction of the volume of voids over the total volume of the gravel-bed river. According to [7,8], the porosity of sand-gravel mixtures can vary from about 0.10 to 0.50. For example, the measured porosity values in the Rhine River range from 0.06 to 0.48 [9].

In this chapter, we present a review of sediment tracing studies in gravel bed streams. Our primary objective is to critically assess the use of tracers for obtaining information on sediment dispersion and transport rates in streams. We first report on methods for the estimation of bed material transport using tracers.
