Prerequisites for learning decorators. Functions can
be passed as arguments to another function. If you
have used functions like map, filter and reduce in
Python, then you already know about this. Such
function that take other functions as arguments are
also called higher order functions. Here is an example
of such a function.

Guide to: Learning Python Decorators by Matt Harrison

How does Decorator work in Python? Mainly, decorators are a construct that wraps a function, gives it a new functionality without changing the original code. They return the output which may differ from the original behavior of the function. They are good to use when a function has to operate differently in different situations. Create your decorator:

Decorator provide a very useful method to add functionality to existing functions and classes. Decorators are functions that wrap other functions or classes. One example for the use of decorator are static methods. Static methods could be function in the global scope but are defined inside a class.
