a Stirling engine to function as an electric generator. Stirling engines operate on a regenerative thermodynamic cycle where the working fluid is enclosed within the engine. Fluid flow is modulated by changing volumes within the engine. The two pistons of the engine are exposed to a hot source and cold source, respectively.

Hot Air Engines - Myers Engine Works

Hot air engines use the heating and cooling and expansion and contraction of air to generate power. The hot air engine was once very popular for light duties, largely because of what it did not have; a boiler. It was impossible to have a boiler explosion.

Boyd's Tin Can Stirling Hot Air Engines

A Stirling engine is a heat engine that is operated by a cyclic compression and expansion of air or other gas (the working fluid) at different temperatures, such that there is a net conversion of heat energy to mechanical work.
