Video transcript. Each of these layers is called a lamellae. In the center of these layers is a canal called the haversian canal, or central canal. In this canal travels blood vessels, lymph vessels and nerves as well. Now in between these sheets of lamellae are these tiny channels that are called canaliculi, which you can kind of see here.

The skeletal system quizzes. There are 206 bones in a typical human body, providing a range of important functions: They provide a framework that supports the body. They protect the organs within the body cavities from mechanical injury. They contain and protect the red bone marrow. They provide a storage site for inorganic salts (e.g.

The human skeleton contains 206 known bones and because of its sheer scope, a classification system had to be invented. Typically, bones are classified into four categories by shape: long, short, flat, and irregular. The skeleton is again classified into smaller and more specific groups which we'll discuss in future publications.
