Cylinder (engine) - Wikipedia
A two-stroke (or two-cycle) engine is a type of internal combustion engine which completes a power cycle with two strokes (up and down movements) of the piston during only one crankshaft revolution. This is in contrast to a "four-stroke engine", which requires four strokes of the piston to complete a power cycle during two crankshaft revolutions.

HOW IT WORKS: Internal Combustion Engine
Cylinder (engine) Multiple cylinders are commonly arranged side by side in a bank, or engine block, which is typically cast from aluminum or cast iron before receiving precision machine work. Cylinders may be sleeved (lined with a harder metal) or sleeveless (with a wear-resistant coating such as Nikasil).

An Internal Combustion Engine is a combination of various types of parts. When I. C. Engine parts function in a pre-determined way, you will convert the chemical energy of fuel into mechanical energy. Basically, two types of internal combustion engines are developed by automotive engineering technology.

Internal Combustion Engine Basics | Department of Energy
Ignition system. The ignition system of an internal combustion engines depends on the type of engine and the fuel used. Petrol engines are typically ignited by a precisely timed spark, and diesel engines by compression heating. Historically, outside flame and hot-tube systems were used, see hot bulb engine .

Two-stroke engine - Wikipedia
Internal combustion engine. The term internal combustion engine usually refers to an engine in which combustion is intermittent, such as the more familiar four-stroke and two-stroke piston engines, along with variants, such as the six-stroke piston engine and the Wankel rotary engine.

The principle of working of both SI and CI engines are almost the same except the process of the fuel combustion. In SI engines, the burning of fuel occurs by a spark generated by the spark plug. In CI engines the burning of the fuel occurs due to compression of the fuel to excessively high pressures which does not require any spark.

What is an IC engine? - Quora
A motorcycle engine is an engine that powers a motorcycle. Motorcycle engines are typically two-stroke or four-stroke internal combustion engines, but other engine types, such as Wankels and electric motors, have been used. Although some mopeds, such as the VéloSoleX, had friction drive to the front tire, a motorcycle engine normally drives the rear wheel, power being sent to the driven wheel by belt, chain or shaft. Historically, some 2,000 units of the Megola were produced between 1921 ...

In an internal combustion engine (ICE), the ignition and combustion of the fuel occurs within the engine itself. The engine then partially converts the energy from the combustion to work. The engine consists of a fixed cylinder and a moving piston. The expanding combustion gases push the piston, which in turn rotates the crankshaft.
