The slope of a line in the plane containing the x and y axes is generally represented by the letter m , and is defined as the change in

the y coordinate divided by the corresponding change in the x coordinate, between two distinct points on the line. This is described by the following equation: $m = \frac{\Delta y}{\Delta x}$. (The Greek letter delta, Δ , is commonly used in mathematics to mean "difference" or "change".)

The happy medium for ramps at home is a ratio of 2:12 or about 10 degrees of incline. A 2:12 ratio gives is not too challenging for wheelchair users and cuts the length of a potential ramp in half. For example, at a 1:12 ratio, a ramp that sits 36 inches high is then 36 feet long. It is 18 feet long at a 2:12 ratio.

A sled starts from rest at the top of a snow-covered incline that makes a θ angle with the horizontal. After sliding 75 m down the slope, its speed is 14 m/s. Use the work-energy theorem to calculate the coefficient of kinetic friction between the runners of the sled and the snowy surface.
