Intro Phase Equilibria in Ceramics: Clifton G. Bergeron ...

Phase Diagrams and Phase Equilibria This course picks up with an overview of basic thermodynamics and kinetics as they pertain to the processing of crystalline materials. The first module deals with phase diagrams - charts that tell us how a material will behave given a certain set of variables such as temperature, pressure, and composition.

The liquid phase is the bubble point curve ( $P - x_1$ ); the vapor phase is the dew point curve ( $P - y_1$ ). Tie lines are horizontal at constant pressure and they connect equilibrium states of liquid ( $x_1$ ) and vapor ( $y_1$ ) phase compositions. The critical point (cp) separates the bubble point and dew point curves.

If the system solid-liquid is at equilibrium and the pressure is increased the phase with the highest density should be favored (that is, it should be thermodynamically stable). Which phase, Solid or Liquid, has the highest density in this system? solid liquid neither. The boiling-condensation and sublimation curves can be analyzed in a similar fashion.

phase some molecules will re-enter the liquid phase and a situation will be established whereby the rate of evaporation will equal the rate of condensation – i.e., a dynamic equilibrium between the liquid and gas phase will exist. The established pressure in the gas phase is referred to as the equilibrium vapor pressure, which is normally

The nature of phase diagrams may be approached by first considering a one component (unary) phase diagram (see Fig. 1.1). In a single-phase region of such a diagram  $f = 1 - 1 + 2 = 2$ , so temperature and pressure can be varied independently and still remain in the single-phase region. However, along the lines defining two-phase equilibria, there is only one degree of freedom, so T and P cannot ...

Le Chatelier's Principle of Chemical Equilibrium - Basic Introduction

And, by definition, a chemical reaction is not an equilibrium process. If a reaction is exothermic then a rise in temperature favors the reactants. Although most of the phase diagrams we use in ceramics are for a pressure of 1 atmosphere, in one-component systems such as carbon, pressure is a very important variable.
