Nearest-neighbor-search classifiers are attractive but they have high intrinsic computational demands which limit their practical application. In this paper, we propose a coprocessor for k (k with $k \geq 1$) nearest neighbor (k NN) classification in which squared Euclidean distances (SEDs) are mapped into the clock domain for

Working of K-nearest neighbor: K-nearest neighbor is a lazy learner i.e. it delays the classification until a query is made. K-nearest neighbor is a type of supervised learner stating this we mean that the dataset is prepared as (x, y) where x happens to be the input vector and y is the output class or value as per the case.
