SPECKLE NOISE IN ORBITAL LASER DOPPLER VIBROMETRY 1
Phase Doppler Interferometry (PDI) Phase Doppler Interferometry (PDI) measures the diameter and velocity of small droplets. The measurement of drop size distribution and mean values can be done without the requirement of assuming a distribution function. It is based on the laser light wavelength which is known to high accuracy.

Real-time laser Doppler and phase Doppler signal processors
"Laser-Doppler Flowmetry" is a descriptor in the National Library of Medicine's controlled vocabulary thesaurus, MeSH (Medical Subject Headings). Descriptors are arranged in a hierarchical structure, which enables searching at various levels of specificity.

Laser Doppler velocimetry - Wikipedia
Laser Doppler and phase Doppler signal processors 231 To discriminate a single tone signal, the signal to noise power ratio (S/N) as a criterion has to be calculated for each burst: S/N (dBI = 10 log (SIT) (3) where S is the power at and adjacent to the dominant frequency and T is the summation of the remaining power.

The phase Doppler instrument's laser transmitter unit emits two coherent laser beams of the same wavelength (color). At the intersection of these lasers, an interference pattern is formed by the constructive and destructive interference of the two lasers, and a known interference wave frequency is generated.

Laser Doppler velocimetry, also known as laser Doppler anemometry, is the technique of using the Doppler shift in a laser beam to measure the velocity in transparent or semi-transparent fluid flows or the linear or vibratory motion of opaque, reflecting surfaces. The measurement with laser Doppler anemometry is absolute and linear with velocity and requires no pre-calibration.

Laser Doppler Velocimetry
Backed by over 25 years of producing Phase Doppler and laser Doppler systems, versatility is not only a design goal: it is built-in. The Phase Doppler Method is based upon the principles of light scattering interferometry. Measurements are made at a small, non-intrusive optical probe volume defined by the intersection of two laser beams.

The phase shift between the Doppler signals from different detectors is a direct measure of the particle diameter. Principles. The PDA technique is an extension of laser Doppler anemometry and is based upon phase Doppler principles. Two or more detectors collect the light scattered by single particles passing through the measurement volume.
