*Lubricants as additives for polymers assist the movement of one object passing another object. Their primary role is to reduce friction, minimize wear and prevent overheating of parts. While wear and heat cannot be completely eliminated, reducing them to negligible or acceptable levels is must to maintain performance in your application!*

*The important factor of the viscosity index (VI) was determined. The data of the dependence of VI on the concentrations are listed in Table 2. It is noticed that, viscosity index (VI) increases with increasing the concentration of the polymeric additive in the range (2-10%) by weight as in Fig. 2. This may be due to the fact that, when the polymer additive dissolves in oil,*

Functionalizing agents are  
additives that improve the  
properties of the polymer or  
confer characteristics that the  
original polymer does not  
possess. Adding functionalizing  
agents extends the range of  
applications for which polymers  
can be used, and enables the  
range of applications of individual  
polymers to be widened.*
