*1. Modular Properties Lemma 1. For any magic 3 3 square of squares which is primitive, the corresponding sum must be  $s = 3 \pmod{72}$ , and the (square) elements must be  $1 \pmod{24}$ . Proof. The idea of the proof is to find all possible magic squares of squares modulo  $q$  for some prime power  $q$ . Since elements are squares, this adds some additional ...*

*Magic Squares and Modular Arithmetic Jim Carlson November 7, 2001 1 Introduction Recall that a magic square is a square array of consecutive distinct numbers such that all row and column sums are the same. Here is an example, a magic square of order three:  $\begin{matrix} 8 & 1 & 6 \\ 3 & 5 & 7 \\ 4 & 9 & 2 \end{matrix}$  Fig. 1 The common row (or column) sum is called the magic sum. In ...*

*Modular arithmetic is a system of arithmetic for integers, which considers the remainder. In modular arithmetic, numbers "wrap around" upon reaching a given fixed quantity (this given quantity is known as the modulus) to leave a remainder. Modular arithmetic is often tied to prime numbers, for instance, in Wilson's theorem, Lucas's theorem, and Hensel's lemma, and generally appears in fields ...*
