Q & A: Does magnetism travel through all materials ...

Superconductivity is a set of physical properties observed in certain materials where electrical resistance vanishes and magnetic flux fields are expelled from the material. Any material exhibiting these properties is a superconductor. Unlike an ordinary metallic conductor, whose resistance decreases gradually as its temperature is lowered even down to near absolute zero, a superconductor has a ...

Flux pinning is the phenomenon where a superconductor is pinned in space above a magnet. The superconductor must be a type-II superconductor because type-I superconductors cannot be penetrated by magnetic fields. Some type-I superconductors can experience the effects of flux pinning if they are thin enough. If the material's thickness is comparable to the London penetration depth,

Resistivity switch is window to role of magnetism in iron ... There are other materials which attract magnetic fields, sort of pulling the field into the material. Although that's the opposite of how the superconductors act, it can also be used to shield things. If you surround something with one of these "mu-metals" the magnetic field will mostly travel through the shield and not penetrate inside.

Superconductor's magnetic persona unmasked: Iron selenide ... The results of a study of AC magnetic hysteresis in sintered pellets of $RBa_2Cu_3O_7$ are presented. The data demonstrate the suitability of Critical State Model as applied with macroscopic parameters characterizing the sintered pellet.
