The simplest form of magnetic energy is the Faraday flashlight, which we have all seen. You shake the flashlight back and forth and the action creates energy to power the light bulb. The principle is simple enough. A magnet passes back and forth through a coil of wire and creates an electrical current that is then stored in a capacitor.

Harnessing magnetism to produce energy is an idea that's been around for years. Several companies on the Internet claim to have produced magnetically powered perpetual motion devices that run completely on their own, infinitely, without ever stopping. Physicists have long warned that such devices are impossible, however.

Magnet Motor Free Energy Generator: Do they Really Work?

Some examples of magnetic energy are a magnetic resonance imaging, or MRI, machine, a compass, the Earth's magnetic field and the starter in a car. Maxwell's equations relates magnetic energy to electric energy. These equations describe how magnetic and electric fields are generated and altered by each other.

Magnets are important for electric generators because spinning a magnet near a coil of wire produces electricity. For example, a wind turbine is using wind to spin the magnet, a hydroelectric facility does the same, but with the power of moving water. A magnet is characterized by its two poles; North and South.

The energy comes from the nucleus of the atoms of Neodymium. Every atom is a magnetic dipole and the magnetic materials have the ability to orientate the axis of the atoms to the same direction when they will find themselves into an external magnetic field. So is created the magnetic force of the magnets. It comes from the nucleus (actually from the rotation of the nucleus)

A magnetic motor (or magnetic energy generator) can provide electricity without having to use fuel. They are typically built with magnets and copper wire coils to provide a greener alternative to electricity. Now think back to science class and the chapter on magnets.

What Is Magnetic Energy? | Reference.com

Moving a magnet around a coil of wire, or moving a coil of wire around a magnet, pushes the electrons in the wire and creates an electrical current. Electricity generators essentially convert kinetic energy (the energy of motion) into electrical energy .

Magnets Energy

Magnetic energy is the energy within a magnetic field. This energy results in various metals either repelling or attracting each other. Magnetism and electricity are closely related but, prior to the 19th century, scientists did not know this. This discovery is thanks to James Clerk Maxwell, a Scottish physicist.
