Polymer science - Wikipedia
Currently, only polymers are bioabsorbable, but both magnesium and iron offer possible avenues for development of alloys with the same property. Other materials science engineers are working to develop metals that have lower susceptibility to magnetization, because current metal implants interfere with MRIs.

Polymers are materials made of long, repeating chains of molecules. There are natural and synthetic polymers, including proteins and rubber, and glass and epoxies.

What Is a Polymer? | Live Science
Polymers are both found in nature and manufactured in laboratories. Natural polymers were used for their chemical properties long before they were understood in the chemistry laboratory: Wool, leather, and flax were processed into fibers to make clothing; animal bone was boiled down to make glues.

Polymer science or macromolecular science is a subfield of materials science concerned with polymers, primarily synthetic polymers such as plastics and elastomers. The field of polymer science includes researchers in multiple disciplines including chemistry, physics, and engineering.

Materials Science in Medical Device Manufacturing
They are an important part of materials science. Polymers are the raw materials (the resins) used to make what are commonly called plastics and rubber. Plastics and rubber are really the final product, created after one or more polymers or additives have been added to a resin during processing, which is then shaped into a final form.
