In general, mean, median, mode and range should ideally all be computed and analyzed for a given sample or data set since they elucidate different aspects of the given data, and if considered alone, can lead to misrepresentations of the data, as will be demonstrated in the following sections.

What are Mean, Median, Mode and Range?

In statistics, the mode in a list of numbers refers to the integers that occur most frequently. Unlike the median and mean, the mode is about the frequency of occurrence. There can be more than one mode or no mode at all; it all depends on the data set itself. For example, let's say you have the following list of numbers:

How to Find the Mean, Median, Mode, Range, and Standard ...

Mean, median and mode are different ways of determining the average from a set of numbers. Range gives the difference between the highest and lowest values. The mean takes the sum of all the values, then divides the total by the number of values given.
