Numerical simulation has become one of important approaches in academia and industry to research-complicated reactive flows in recent years, though it is still a fast developing subject. For combustion in low-speed flows, usually the low-Mach-number assumption is used, which assumes that the change of temperature is unrelated to the hydrodynamic pressure [ 1 , 2 ].

For a reliable scale-up of PCC, model-based process simulation is indispensable. Furthermore, process models are needed for a better understanding of the process in general, troubleshooting, to test process modifications and for training of staff. For the modeling of reactive absorption, only rate-based models are suitable.
