In mathematics, nonlinear programming (NLP) is the process of solving an optimization problem where some of the constraints or the objective function are nonlinear.An optimization problem is one of calculation of the extrema (maxima, minima or stationary points) of an objective function over a set of unknown real variables and conditional to the satisfaction of a system of equalities and ...

Nonlinear programming - Wikipedia
Nonlinear Programming presents recent developments of key topics in nonlinear programming (NLP) using a logical and self-contained format. The volume is divided into three sections: convex analysis, optimality conditions, and dual computational techniques. Precise statements of algorithms are given along with convergence analysis.

Nonlinear Programming (3rd ed.) by Mokhtar S. Bazaraa (ebook)
Most nonlinear programming algorithms are targeted to a particular subclass of problems. For example, some algorithms are specifically targeted to large, smooth unconstrained problems in which the matrix of second derivatives of $f(x)$ contains few nonzero entries and is expensive to evaluate, while other algorithms are aimed specifically at convex quadratic programming problems, and so on.
