Onion Root Cell Cycle Lab Answers | SchoolWorkHelper

This lab was an experiment designed to analyze how many cells could be observed in each part of mitosis for different areas of an onion root. First, with a prepared slide, area X and Y were located and each counted and recorded of what stages were observed. Then, another onion root tip was prepared and area Z was located.

Virtual Mitosis Lab: Part I - Onion Root Tip

(Note: The green onions need to be placed in water for 72 hours before the lab to encourage growth of the roots. The onion root is also a good place because this is the area where the plant is growing. Remember that when cells divide, each new cell needs an exact copy of the DNA in the parent cell. This is why mitosis is only visible in cells that are dividing, like the whitefish embryo and the onion root tip. Mitosis can take several hours to complete.

The type of cell division in normal eukaryotic cells is called Mitosis. Another type of cell division is also present in reproductive cells of eukaryotes is called meiosis.

LAB EXPERIMENT 4: Mitosis in Onion Root Tip Cells

When observing the onion root tip cells for the stage of prophase, the cells took on a brick-like structure and within the cells, small dots (the nuclei) can be seen. In one particular cell's nucleus, the chromatin has condensed so much that it can be seen using a light microscope.

Mitosis Onion Root Tip Lab. 2. To find the number of cells in each stage of mitosis, count them (there won't be that many). 3. To find the number of cells in interphase subtract the number of cells in the different stages of mitosis (prophase, metaphase, anaphase, telophase) from the total number of cells in the field of view.

Spindle fibers align the chromosomes along the middle of the cell nucleus. This line is referred to as the metaphase plate. This organization helps to ensure that in the next phase, when the chromosomes are separated, each new nucleus will receive one copy of each chromosome.

Onion root tips also grow quickly and are only a few cells thick. A stain is used to dye condensed chromosomes—like those undergoing mitosis—a very dark color. By viewing the onion root tip using a light microscope, it is easy to determine if a particular cell is in interphase or mitosis. See Figure 1 for a graphical representa-
