The problem of choosing a portfolio of securities so as to maximize the expected utility of wealth at a terminal planning horizon is solved via stochastic calculus and convex analysis. This problem is decomposed into two subproblems. With security prices modeled as semimartingales and trading strategies modeled as predictable processes, the set of terminal wealths is identified as a subspace ...

Towards the optimal execution literature, we provide a stochastic price impact model that yields a closed-form, feedback solution to the optimal portfolio execution problem. Modelling the stochastic price impact by means of the continuous-time Markov chain proves to be instrumental in deriving the optimal execution strategy of the investor in an explicit form.

Fouque, panicolaou and Sircar [5] also looked at a portfolio optimization problem with stochastic volatility and constant interest rate. In this paper, we consider stochastic volatility as well as stochastic interest and develop an optimal portfolio selection model based upon this more realistic mixed structure. Our problem is formulated in Section 2.

In this paper, first we study a stochastic volatility market model for which an explicit candidate solution to the problem of maximizing the utility function of terminal wealth is obtained. Applying this result, we present a complete solution for the Heston model, which is a particular case of the general model. A verification result and a martingale representation of the solution are provided ...

Abstract: Given an investor maximizing utility from terminal wealth with respect to a power utility function, we present a verification result for portfolio problems with stochastic volatility. Applying this result, we solve the portfolio problem for Heston's stochastic volatility model.

Employing the stochastic dynamic programming approach, we establish the associated Hamilton–Jacobi–Bellman equation. Then we solve the optimal investment and consumption strategies for the power utility function. We also consider a special case in which the price process of the stochastic factor degenerates into a Cox–Ingersoll–Ross model.
