The aim of the work is to carry out the diesel engine calibration in a fast and robust manner, while integrating the optimization and smoothing together in one step. This will be carried out by generating several optimum calibrations for each KP, from which, using a suitable approach, the calibration that maximizes performance and smoothness can be selected automatically.

Calibration vs. Tuning. While engine calibration may be a less common term in fleet management, engine-tuning is more widely known. These two terms can be used interchangeably. Both engine calibration and engine-tuning refer to the process of modifying a vehicle's engine parameters to increase the performance of the vehicles.

Nonlinear optimization for reservoir characterization

The optimization engine tries to minimize the OF towards zero. In practice, a maximum tolerance is specified and the process stops when the value of the OF is within this tolerance. In addition to the difference between model and empirical values, one might also consider penalizations for some situations which cannot be accepted by the nature of the problem being evaluated.
