This winding method reaches the highest fill factor and is the best way to fill the available winding cross-section with round wires. Square coils are seen as orthocyclically wound when the winding and layer jump occur only on one of the sides of the winding cross-section. In theory, a geometric fill factor of 0.91 will be reached.

There are two basic winding processes in the paper industry: reeling and winding. The reeling process is used to produce very large rolls of paper or board, called "parent reels," at the dry end of a paper machine. The winding process converts the large parent reels produced on the paper machine into customer-sized rolls that are ready for ...
